Second round reviewer #1 comments

The manuscript has improved; however, the following issues remain:

1. The baseline methods do not use equal simulation budgets. All methods should be evaluated with the same maximum number of Monte Carlo calls.
2. Equation (30) is still incorrect. The authors should use the exponential of the log-probability difference to calculate the PPO probability ratio and make the equation consistent with the implementation.
3. The abstract still reports the old 75% versus 25% results and the unsupported claim of "unique global Pareto optimality." It must be updated according to the revised results.
4. Confidence intervals should be reported for the main development and test feasibility rates of 9/12 and 5/12.
5. The GitHub repository should be publicly accessible, and the exact model versions and experimental dates should be clearly reported.
